Overview

- Study of variability and sensitivity of the model (WRF) to:
 - **LSM** schemes
 - **PBL** schemes
- Validation with observed data for days:
24 and 25 June
- Comparison between **V3.4.1** and **V3.5**

WRF settings

VERSION	WRF-ARW version 3.4.1
INITIAL AND BOUNDARY CONDITIONS	ECMWF data (pressure levels) 0.15° resolution; every 6 h
HORIZONTAL RESOLUTION	3 nested domains Grids of: 9 km, 3 km, 1 km
VERTICAL RESOLUTION	50 eta vertical levels (28 between ground and 1000 m)
TIME STEP	30 s
SPIN UP	12 h
PBL	YSU / MYJ / QNSE
LSM	5-layers / NOAH / RUC

Experiments

Two different exercises with:

a) Fixed **LSM**, varying **PBL**

b) Fixed **PBL**, varying **LSM**

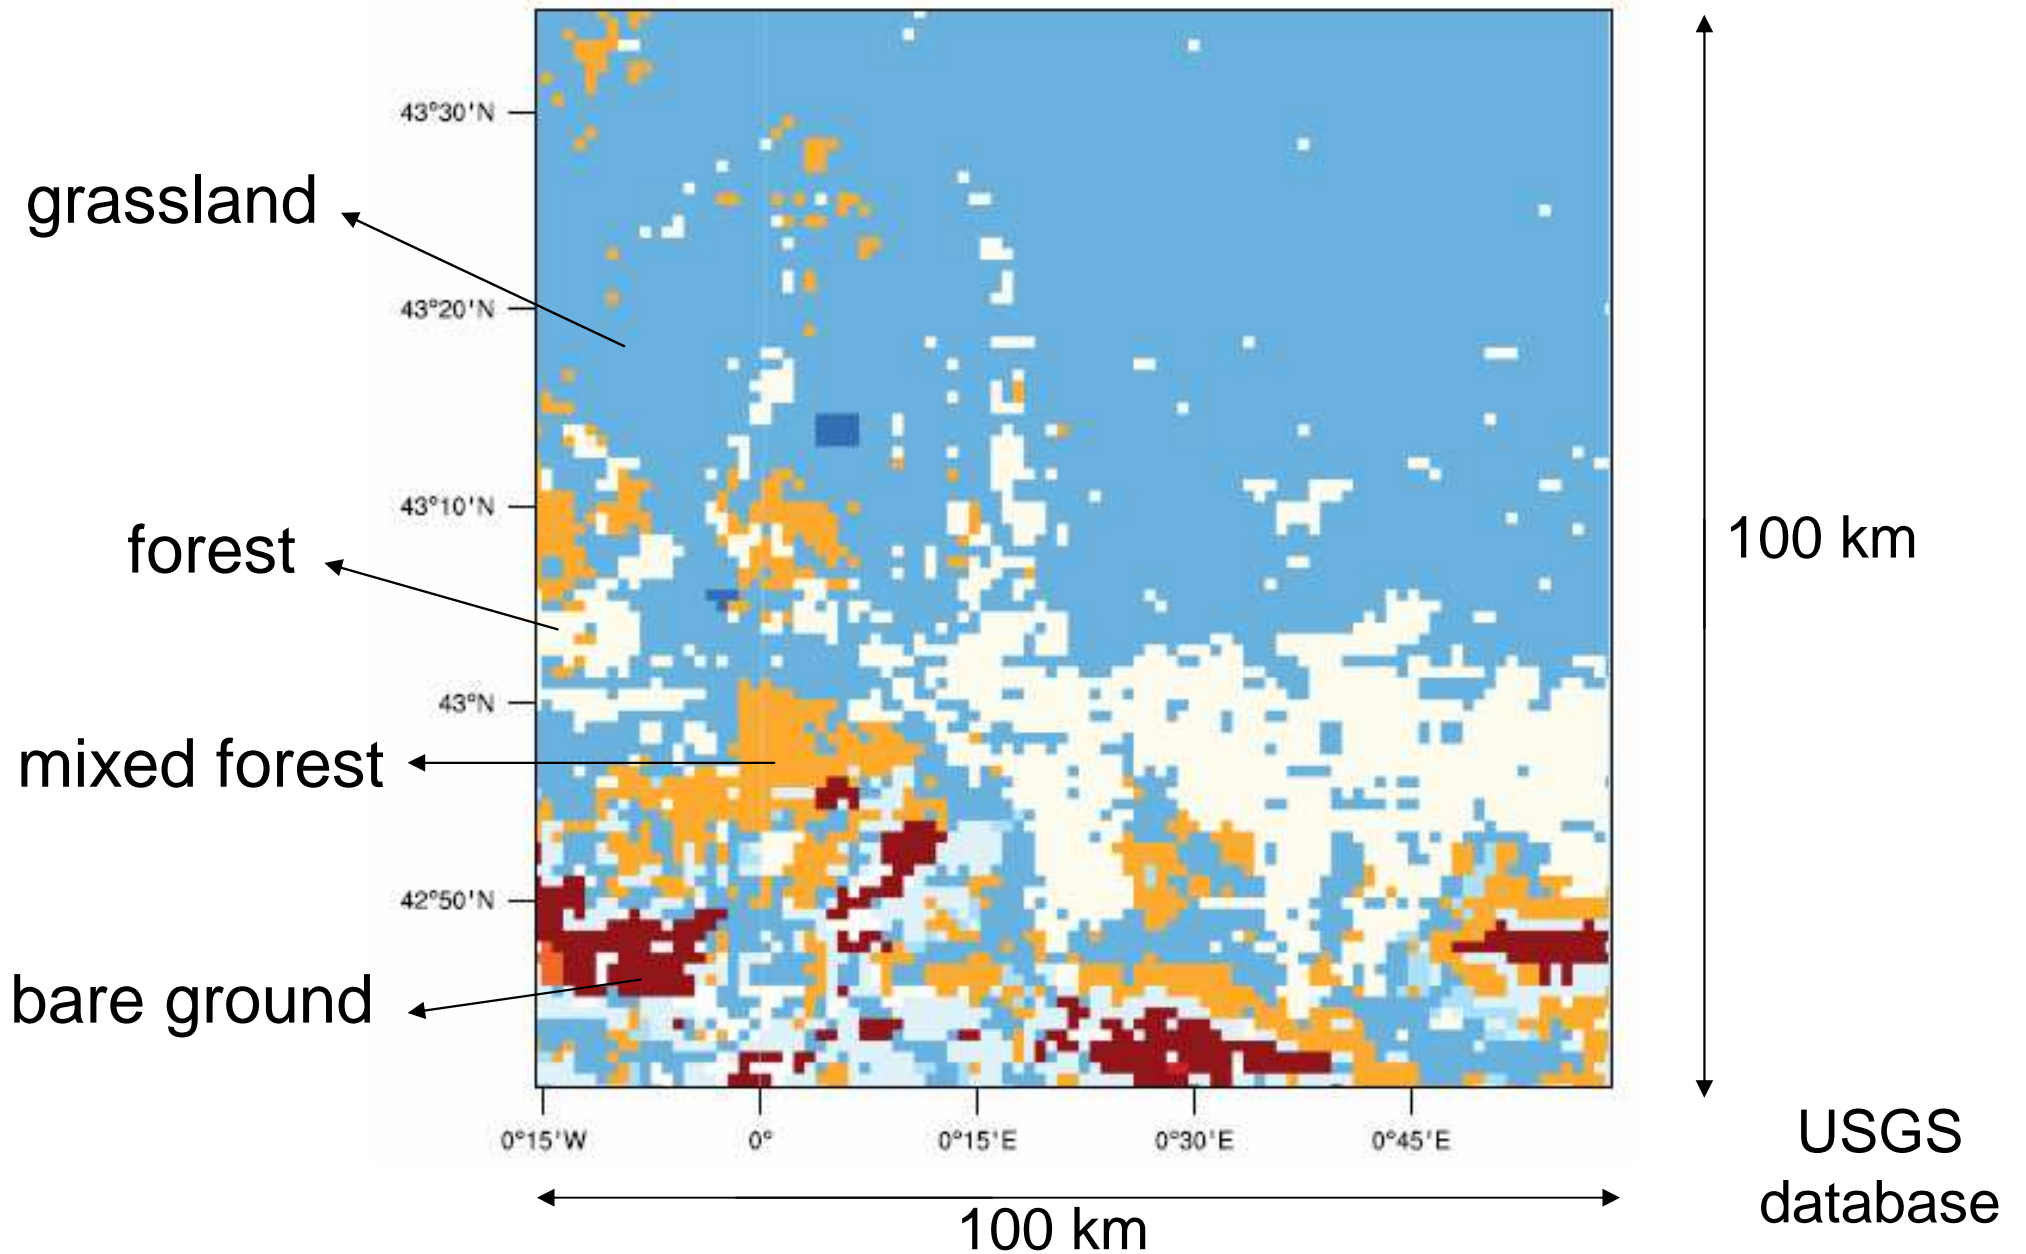

Surface energy balance: **LH, SH, R_N, G**

Surface variables: **T, q**

Turbulence parameter: **u_{*}**

Vertical profiles: **wind, θ , q**

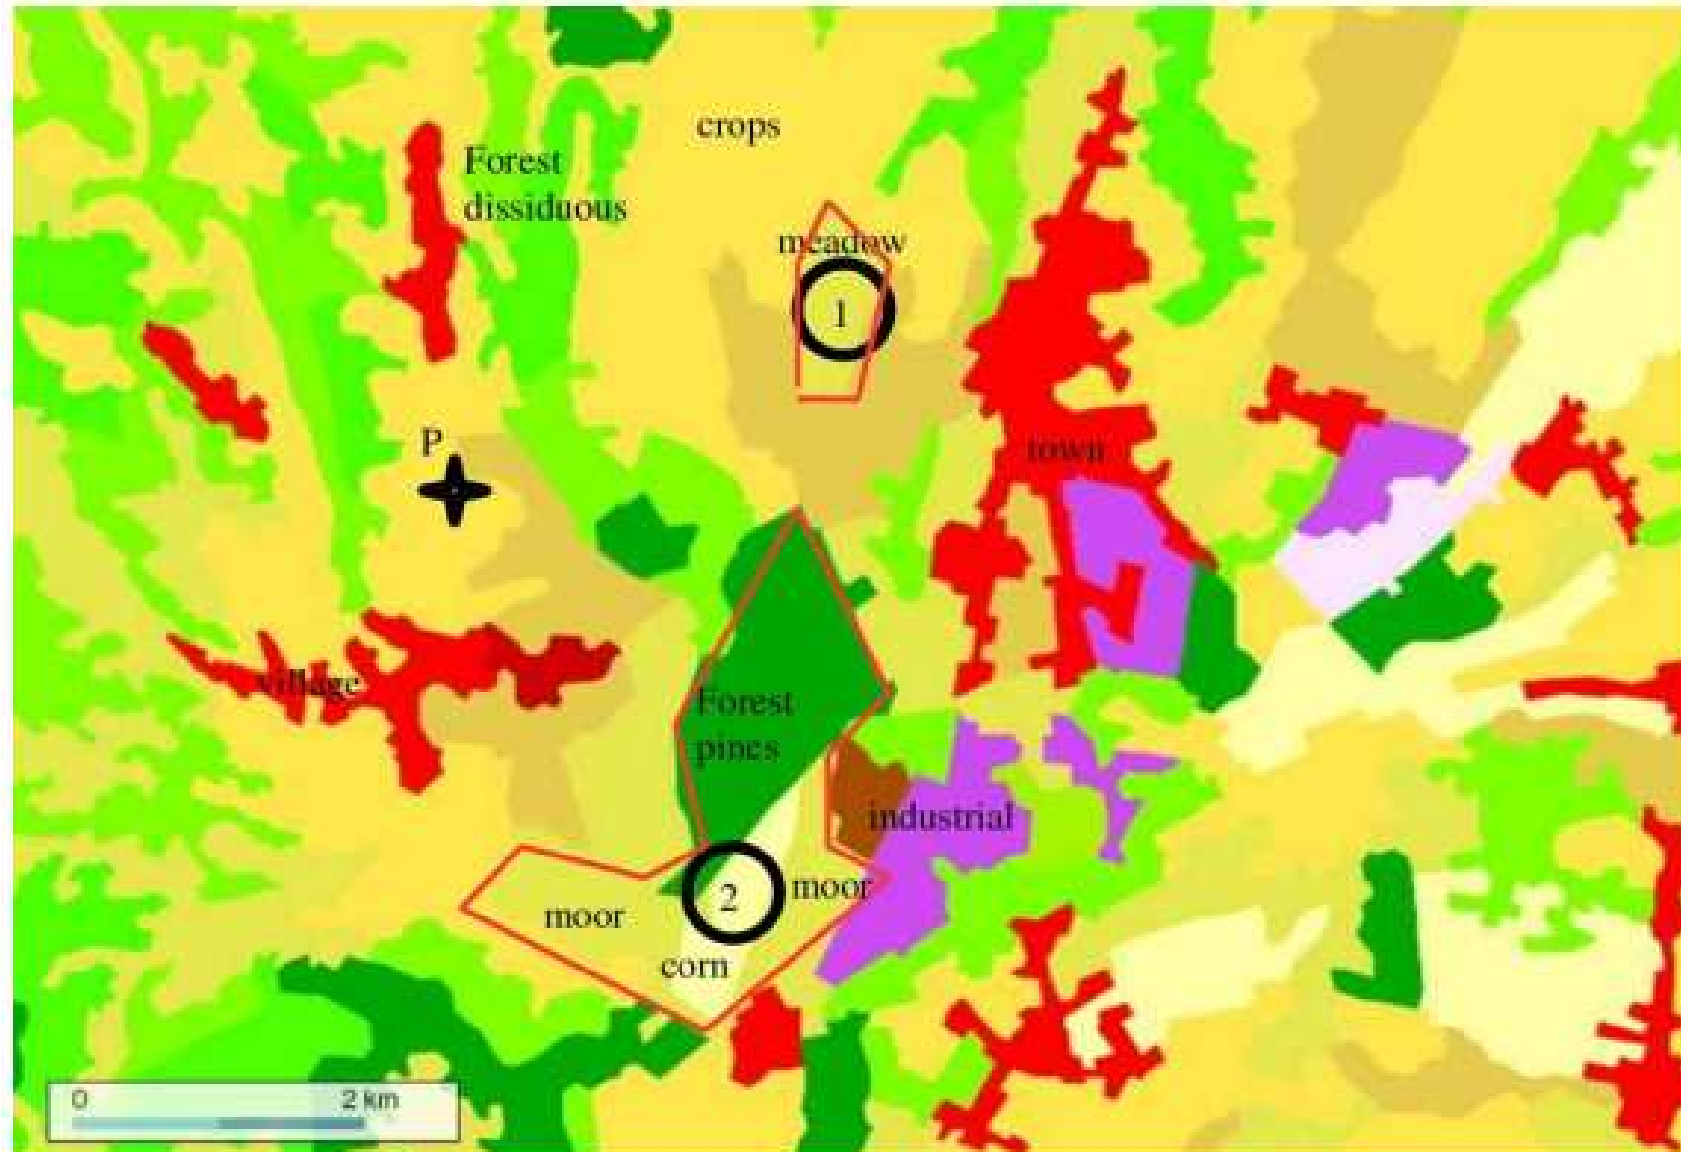

Land use (WRF)

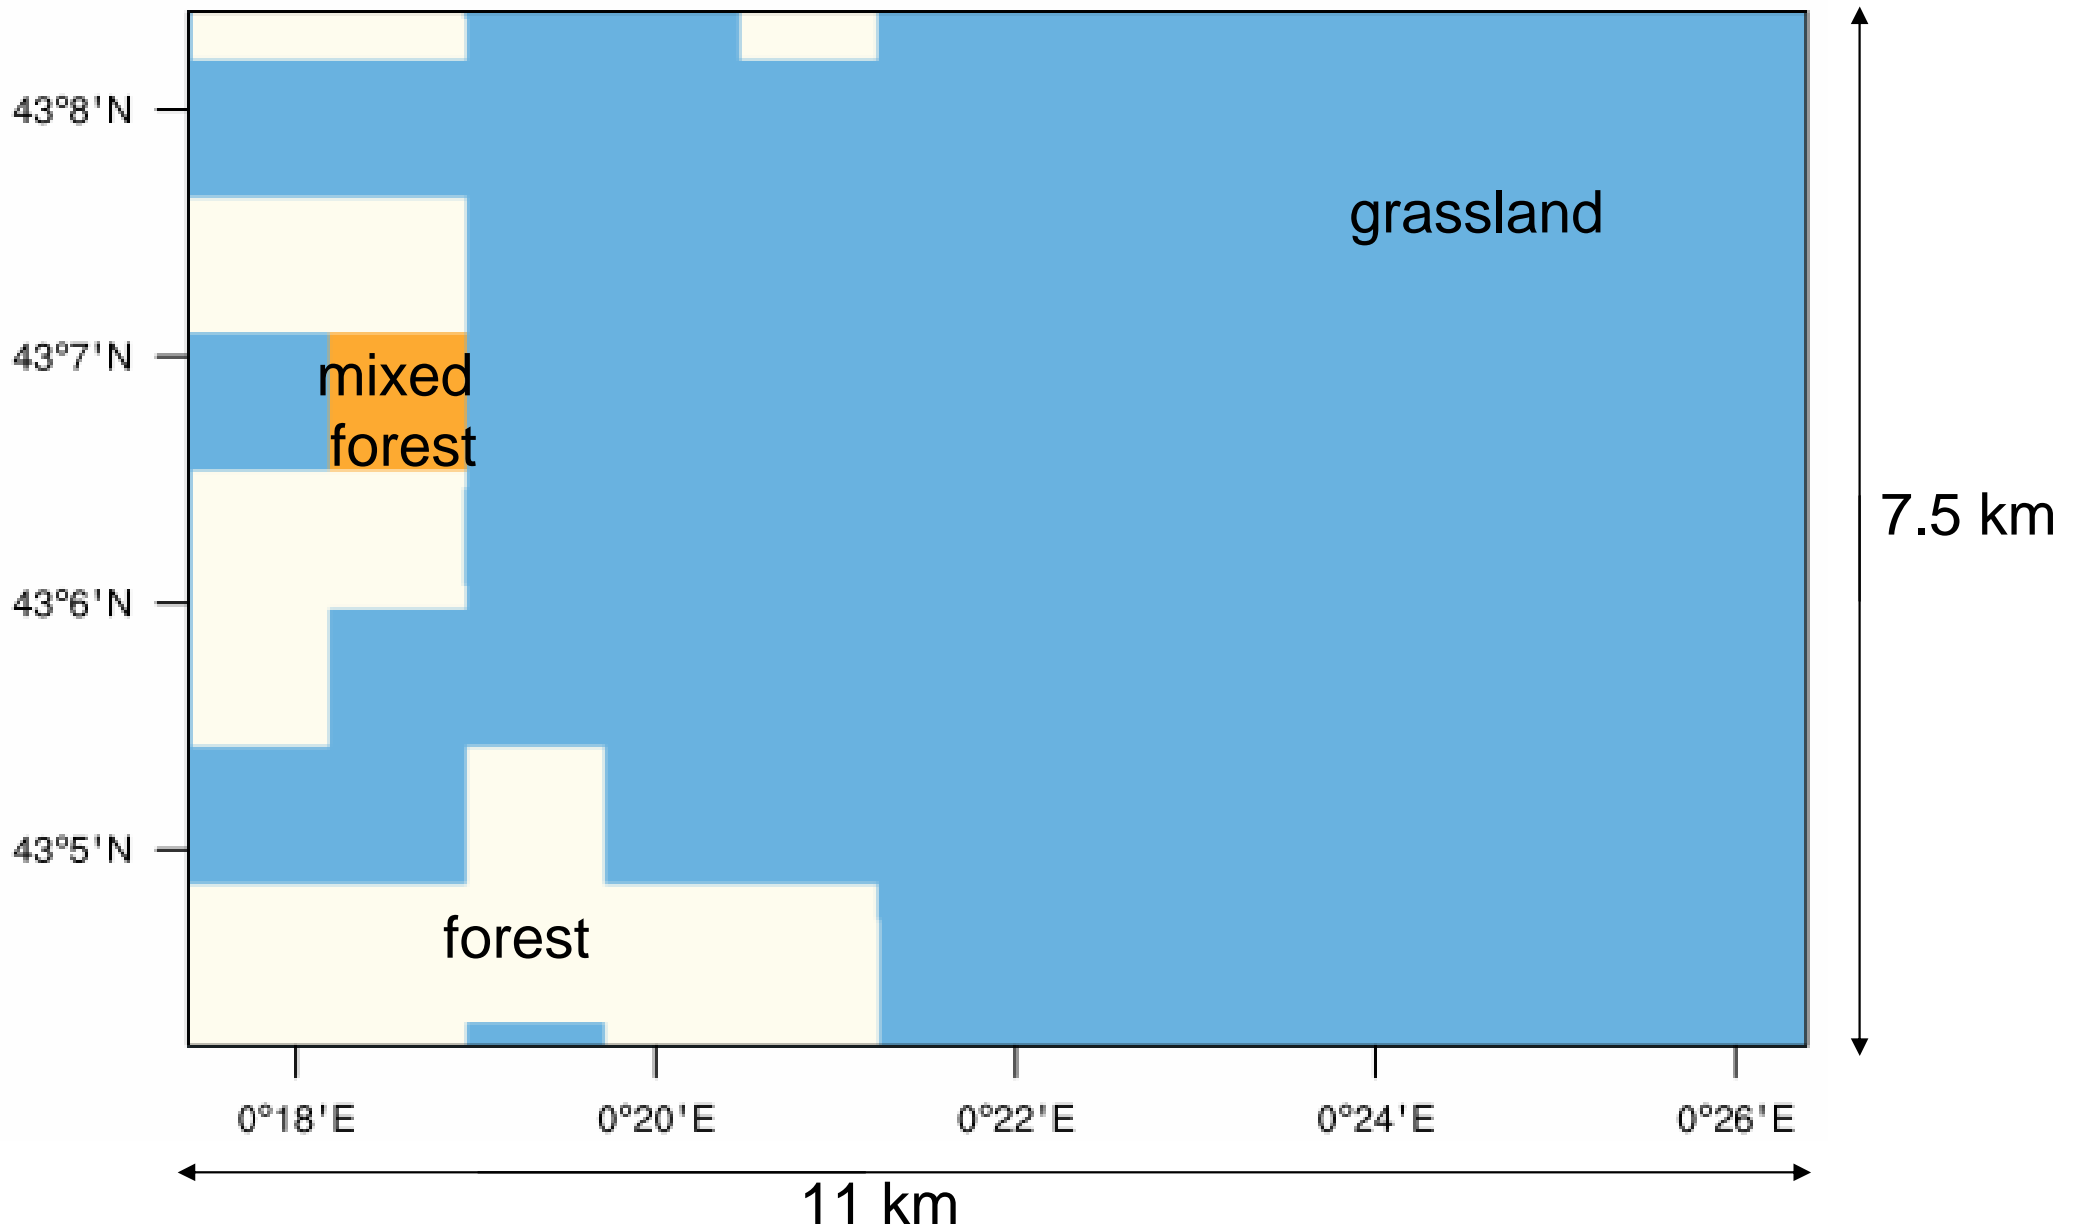

Satellite (Google Earth)

Land cover (CORINE)

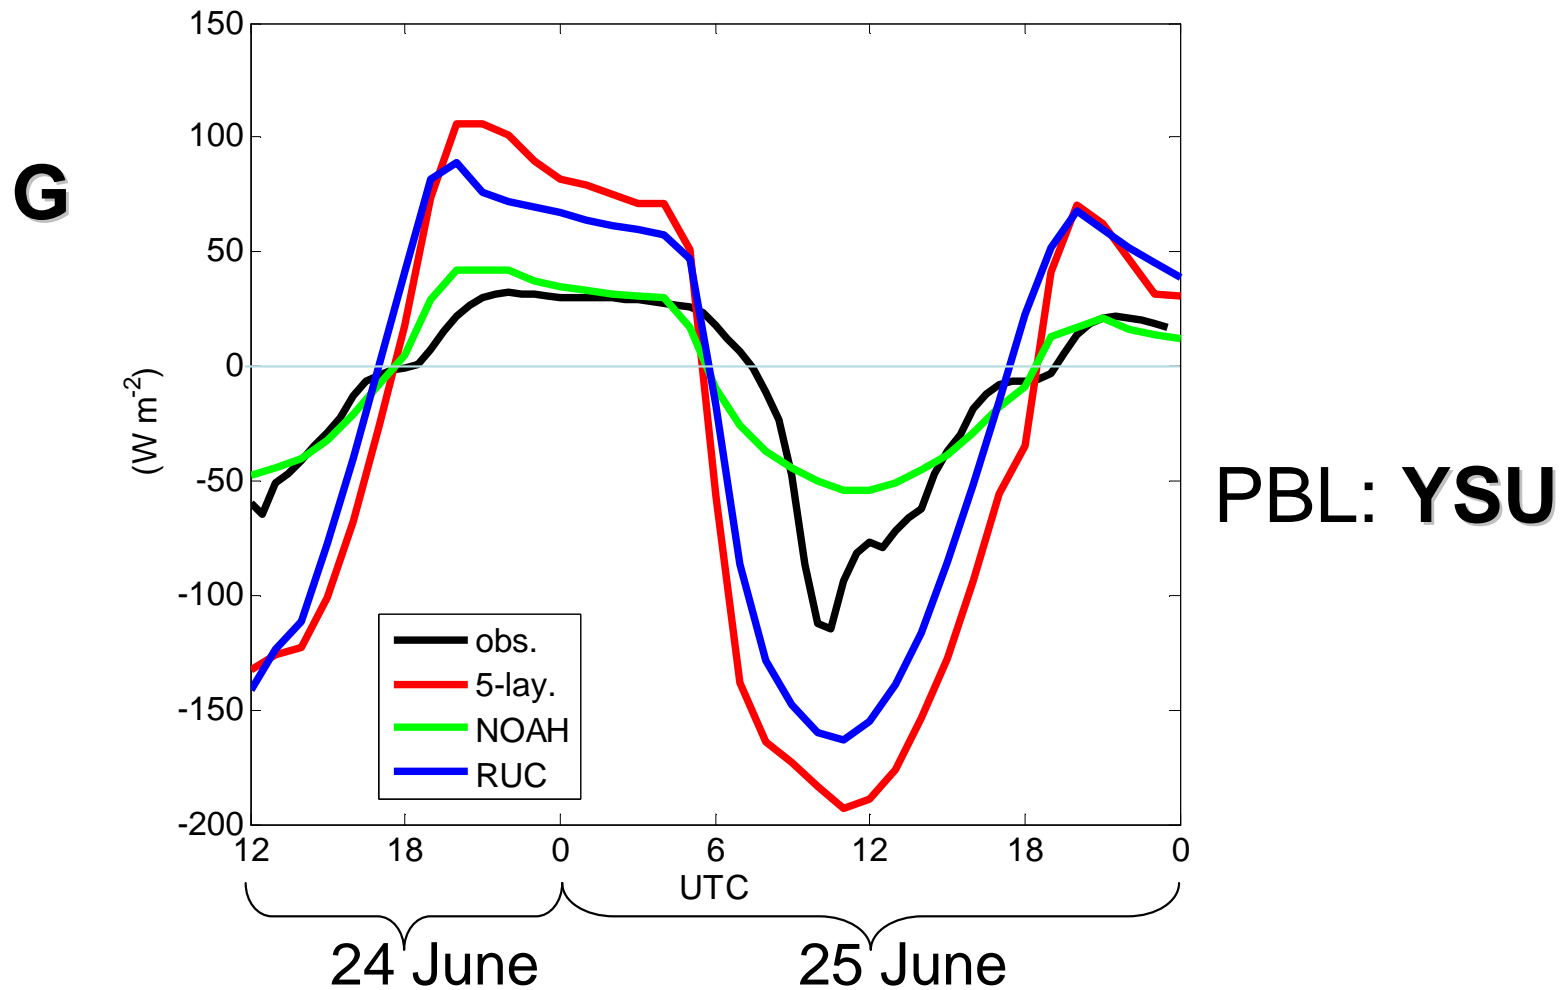

Land use zoom (WRF)

Initial results

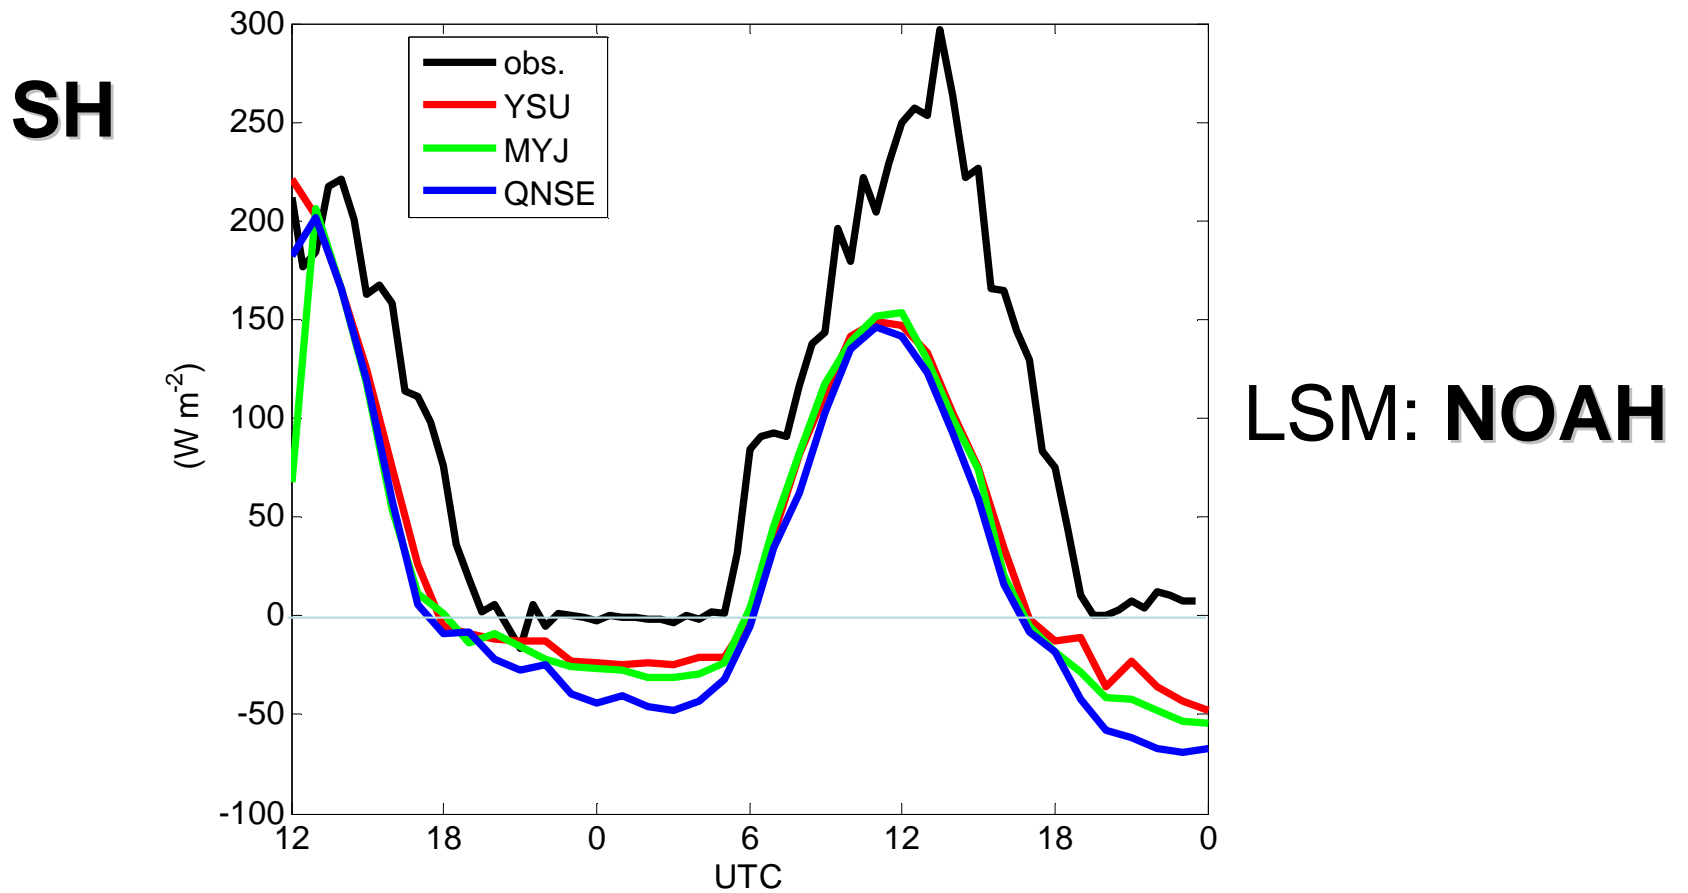

a) Fixed PBL, varying LSM

Great discrepancies among LSM in some terms

Initial results

b) Fixed LSM, varying PBL

Some differences, but smaller than before

5-layer scheme

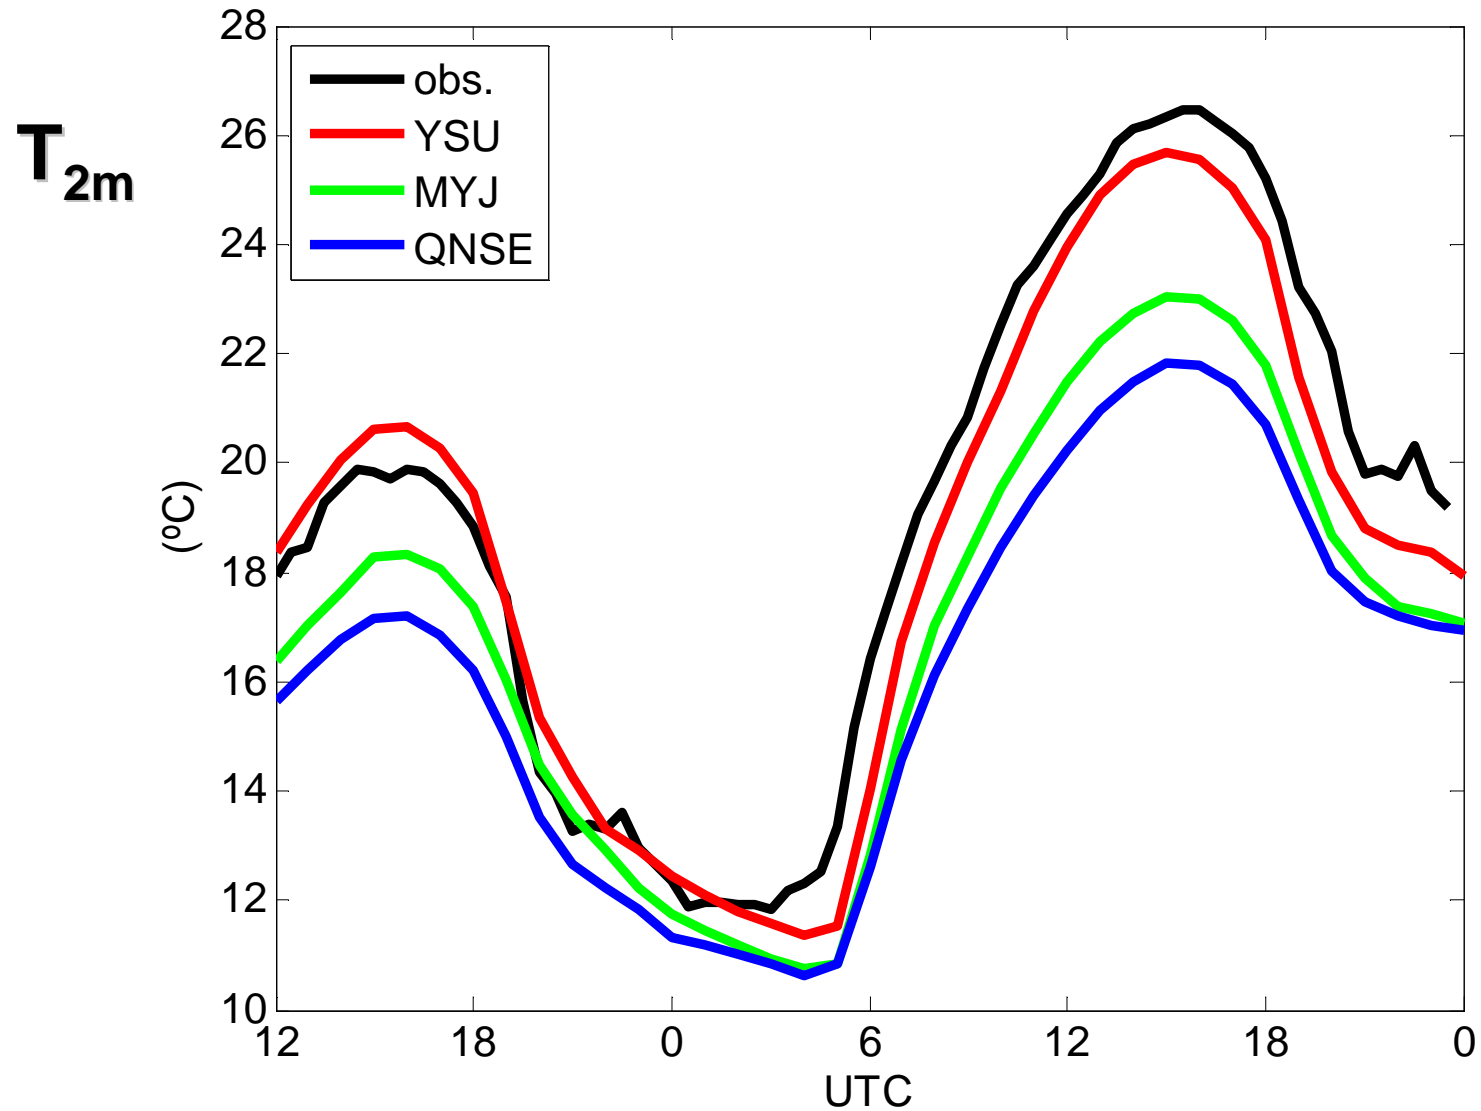

Surface: latent heat flux

LH

5-layer scheme

Surface: temperature

5-layer scheme

Surface: sensible heat flux

SH

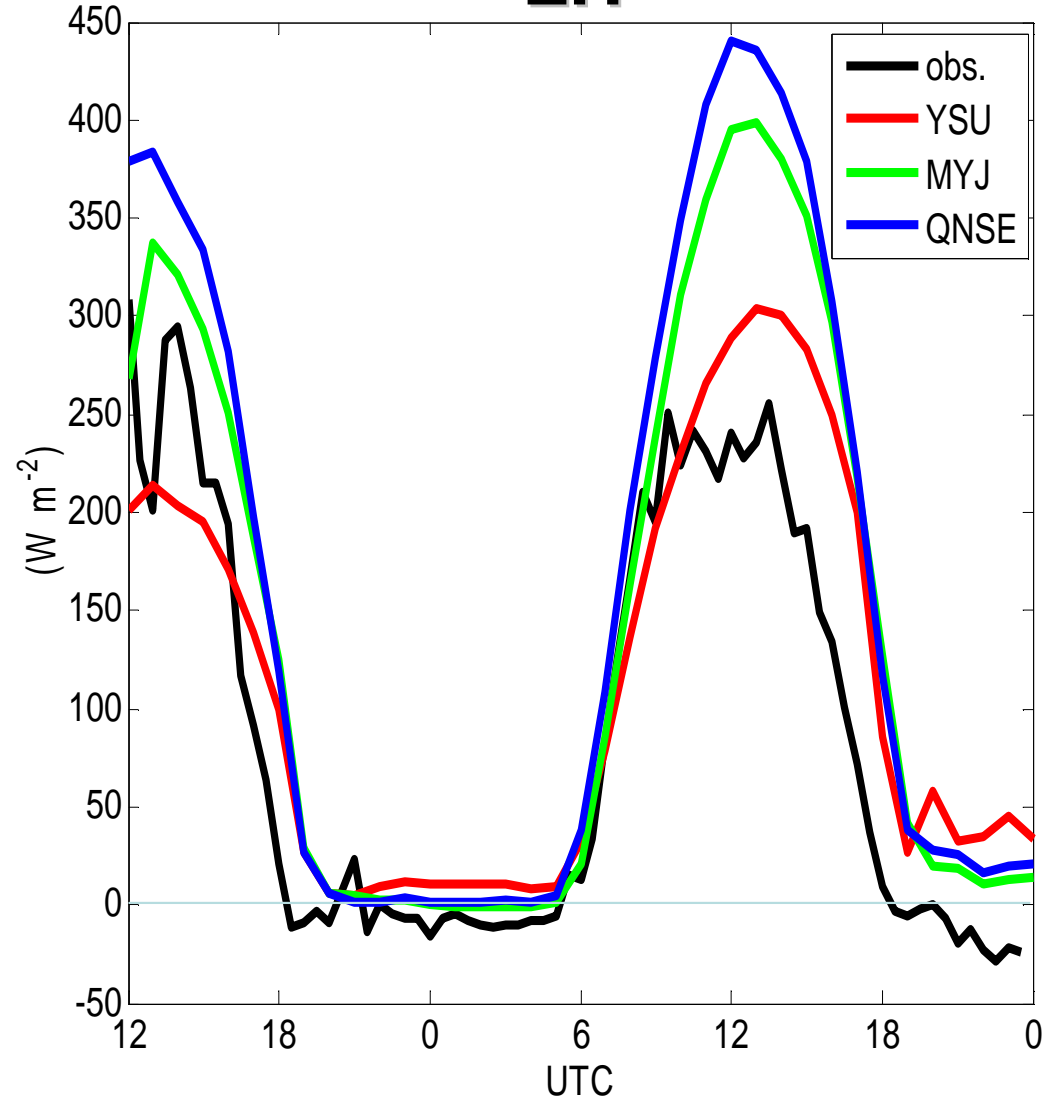

5-layer scheme

Surface

SH

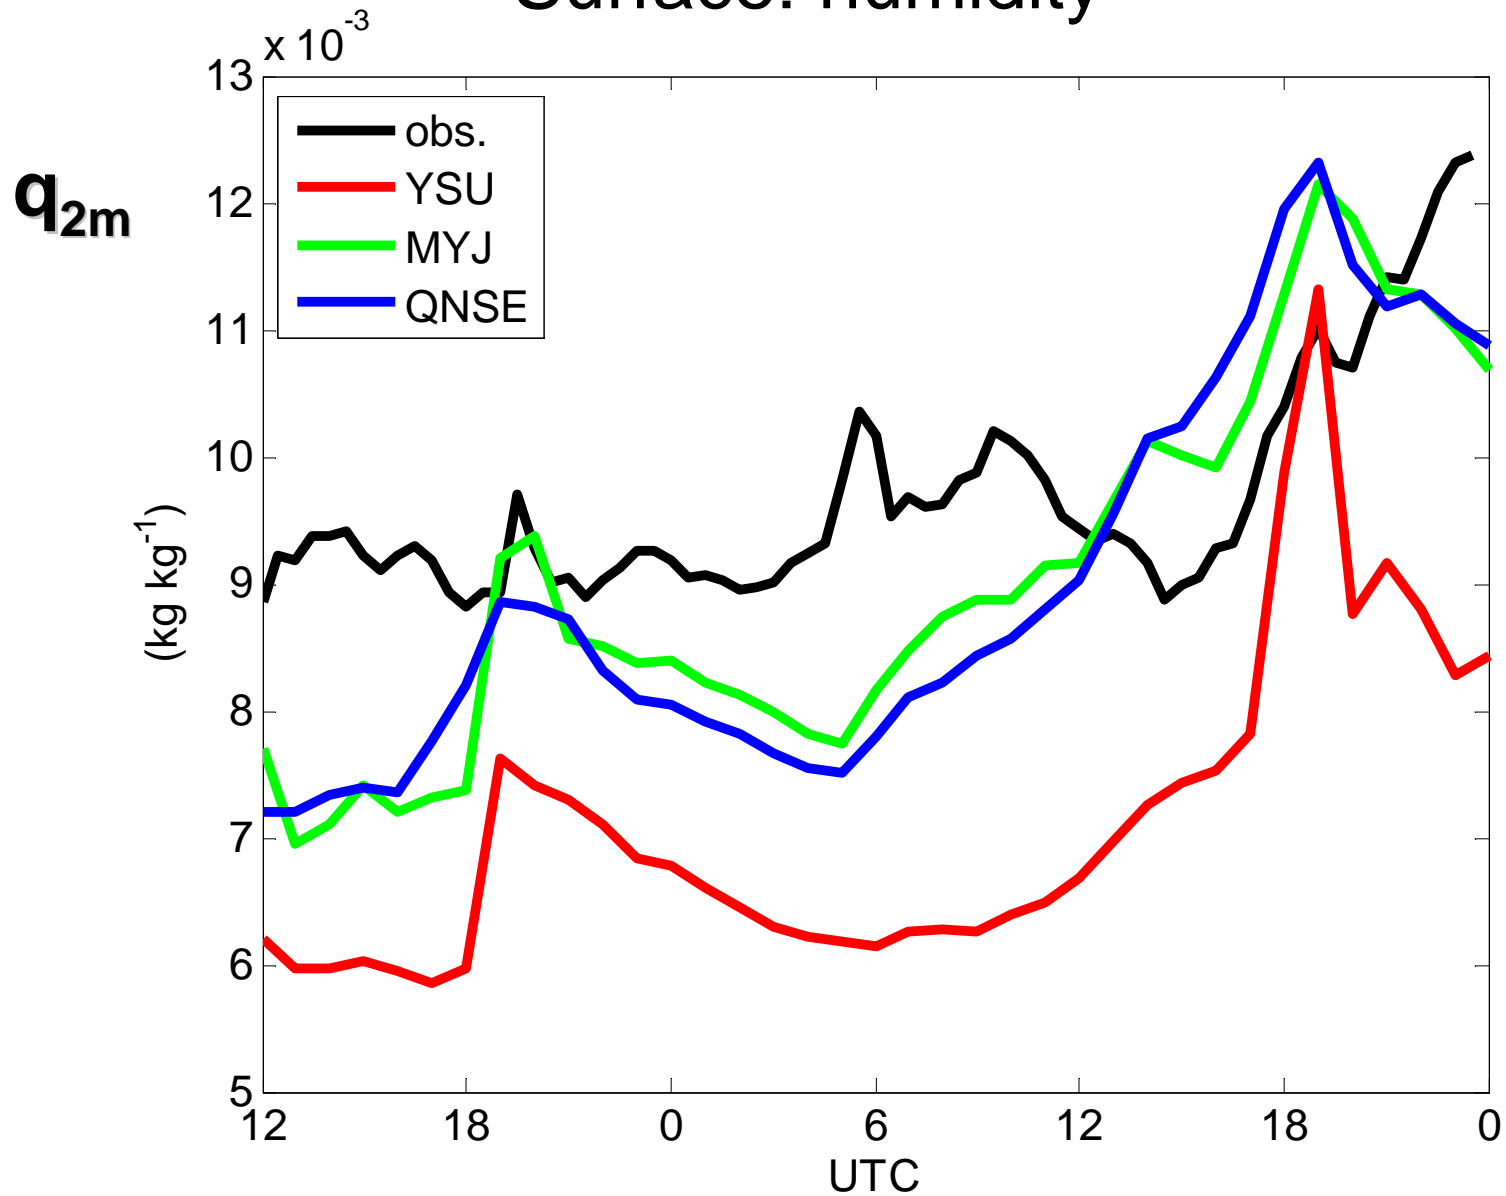

LH

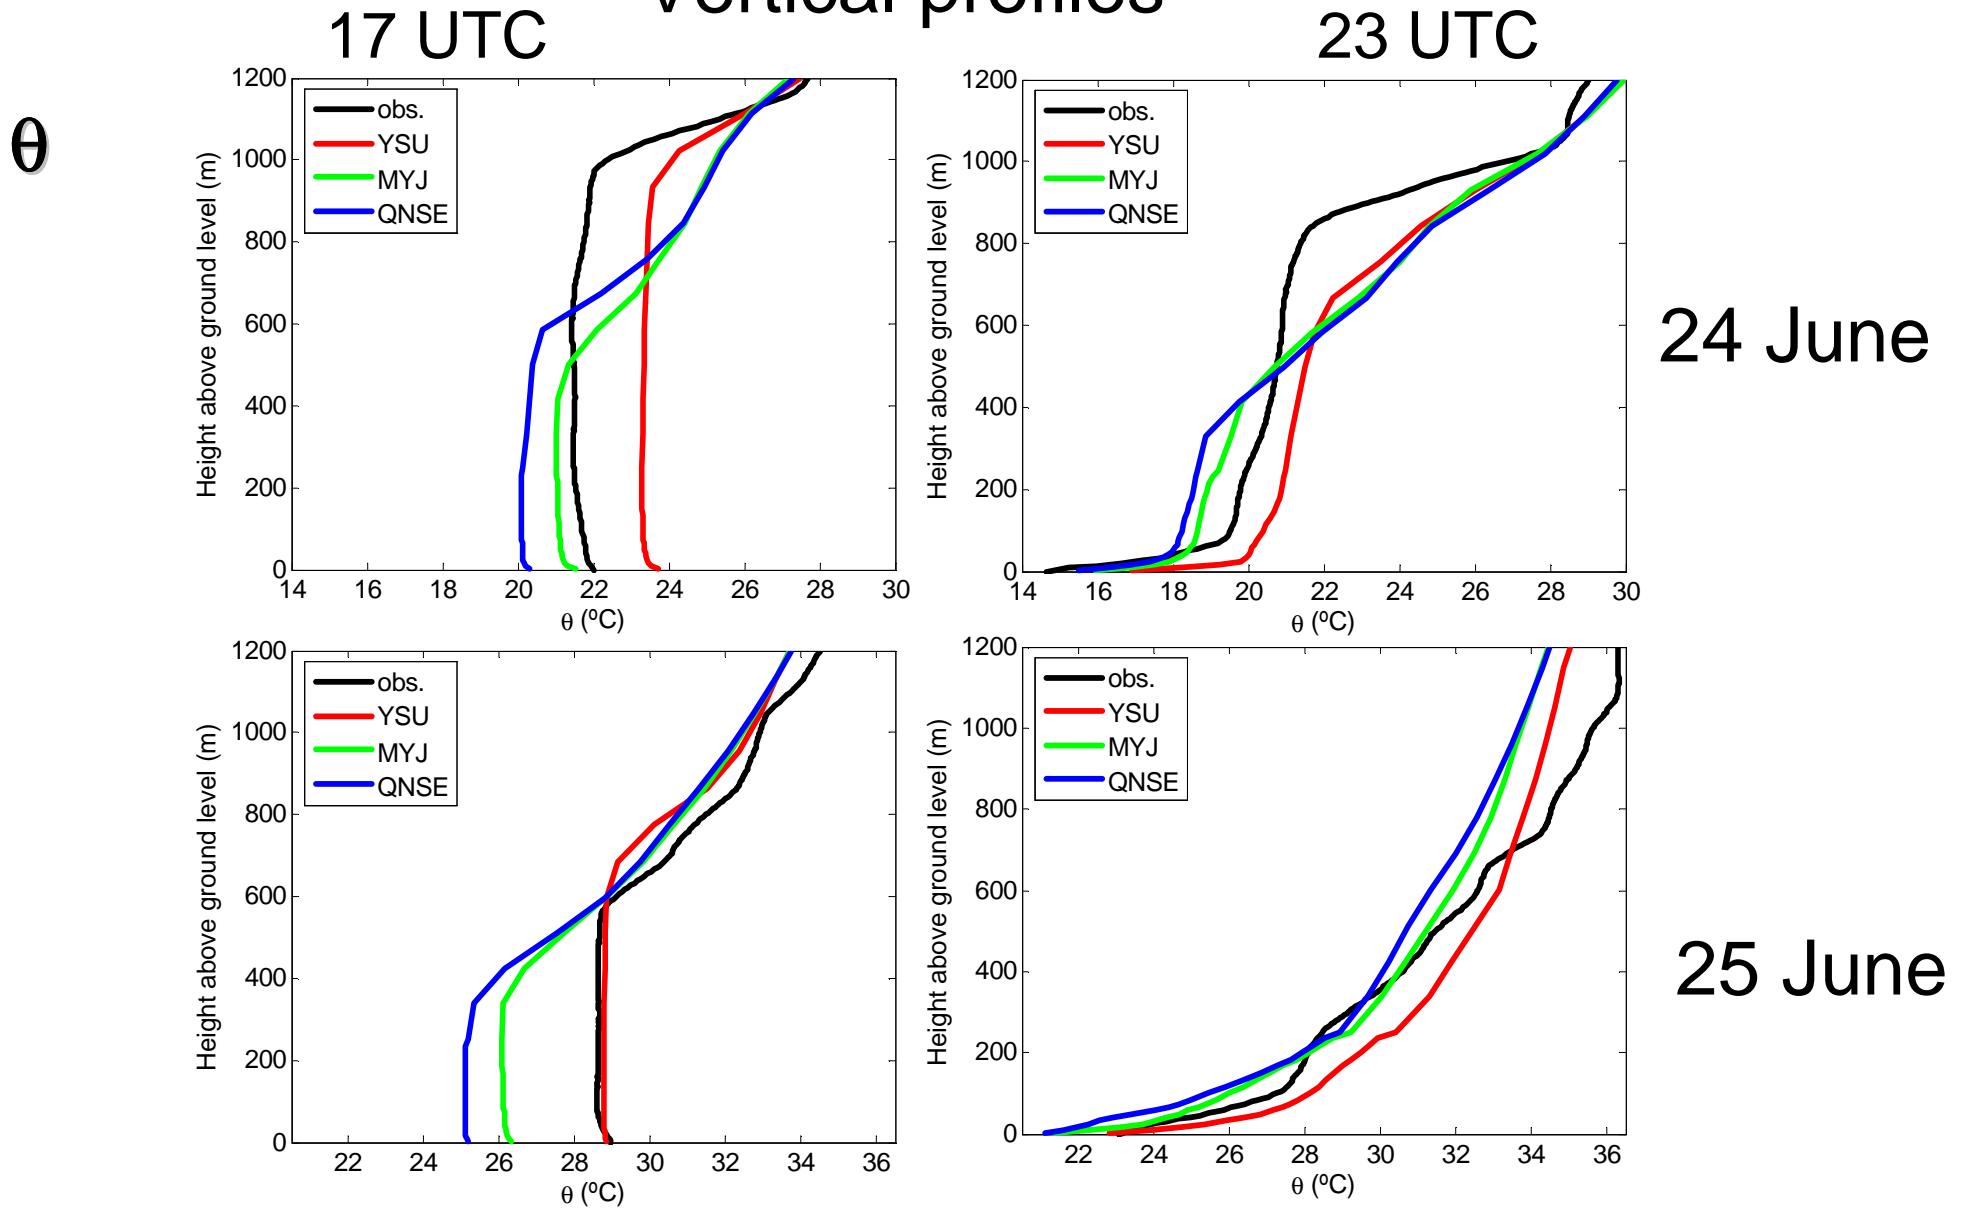

WRF tests: 5-layer scheme

Surface: humidity

5-layer scheme

Vertical profiles

3.4.1 vs. 3.5 version

SURFACE: **SH**
Fixed LSM: **RUC**

3.4.1

3.5

3.4.1 vs. 3.5 version

SURFACE: LH
Fixed LSM: *5-lay*

3.4.1

3.5

3.4.1 vs. 3.5 version

VERTICAL PROFILES: θ

Fixed LSM: **RUC**

3.4.1

3.5

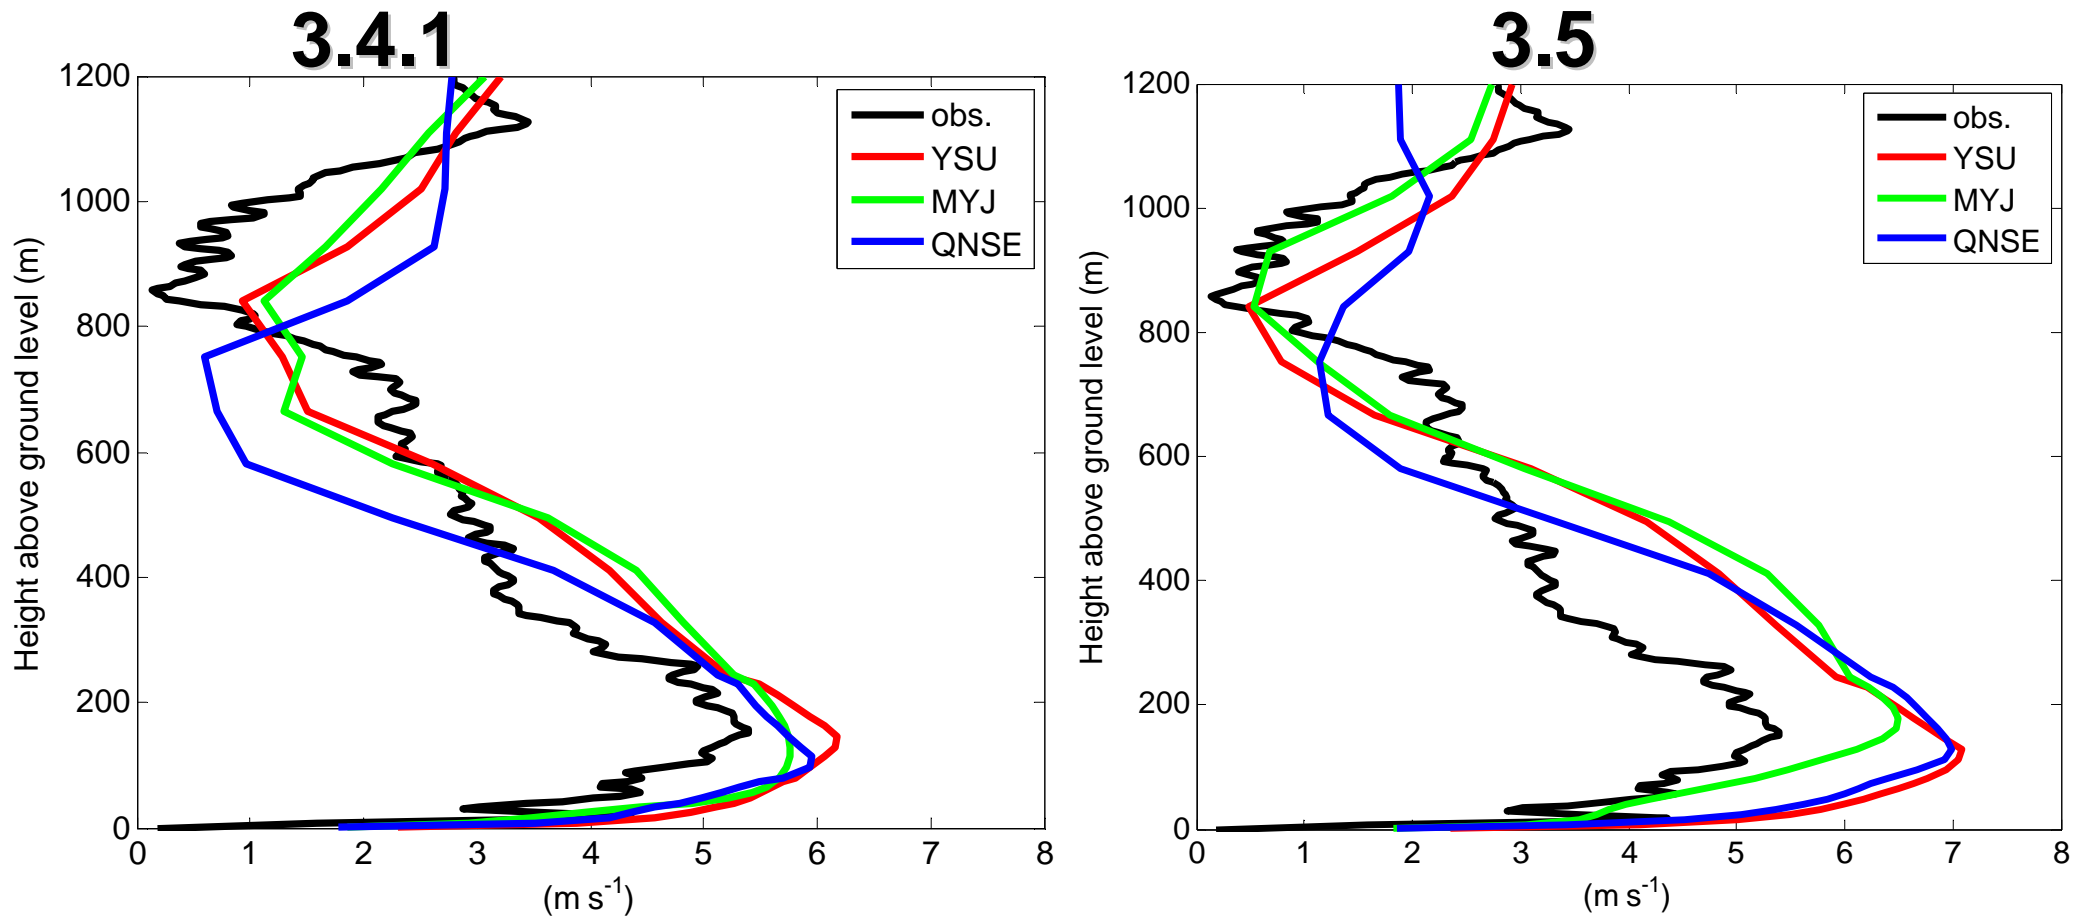

25-Jun, 17 UTC

3.4.1 vs. 3.5 version

VERTICAL PROFILES: WIND MODULE

Fixed LSM: **NOAH**

24-Jun, 23 UTC

3.4.1 vs. 3.5 version

Absolute difference (3.4.1 – 3.5)

LSM: *RUC*

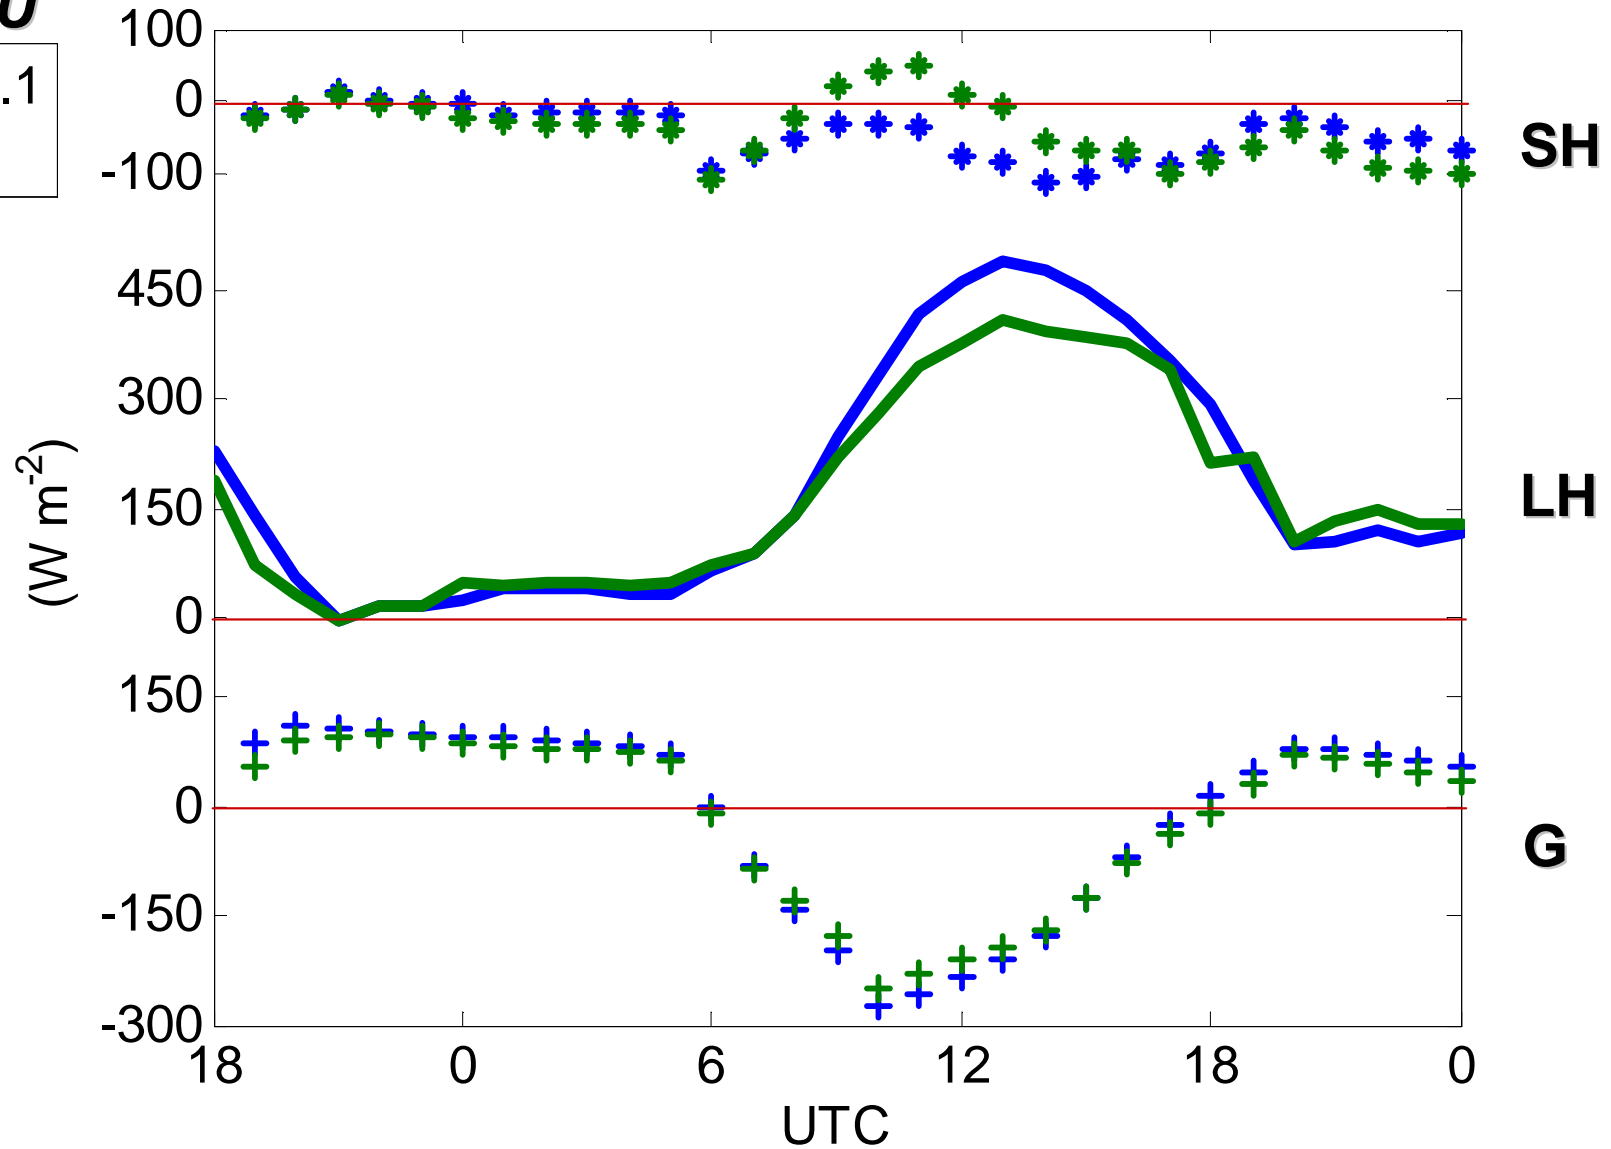

3.4.1 vs. 3.5 version

LSM: *RUC*

PBL: *YSU*

Bias: simulation – observation

Conclusions

- Combined simplest schemes of PBL (**YSU**) and LSM (simple **5-layers**) provide as a whole better results.
- There is more **sensitivity** to changes in **LSM** for a **fixed PBL** than the opposite.
- A **larger spin-up** might be advisable for some combinations of LSM and PBL.
- Version **3.5** is found to perform similarly to **3.4.1** (or slightly better) for the cases studied.

Future work

- Understand latent heat disagreement
- Compare with 60-m tower data (larger footprint?)
- Test other case studies
- Simulate gravity wave events
- Other suggestions?
